Silicon Compound

Description

Silicone Compound is a premium lubricant and sealant paste for rubber components. Silicone Compound is based on a silicone fluid with a high molecular weight, as a result of which the product has outstanding adhesion properties and a 'soft' consistency. Furthermore, Silicone Compound is completely based on FDA-approved ingredients that have very low toxicity and are therefore also perfectly suited for applications that come into contact with drinking water. Silicone Compound does not have any effect on rubber.

Application

Silicone Compound is a premium lubricant and sealant paste for rubber components. This makes Silicone Compound ideally suited for lubricating and sealing O-rings in industrial valves and taps. Silicone Compound can also be effectively applied as an assembly paste when assembling sanitary ware.

Typicals

Density at 15 °C, kg/l	1,000
Flash Point PM, °C	315
